

04 JUN 2022

[This question paper contains 40 printed pages.]

Your Roll No.

Sr. No. of Question Paper : 3495

Unique Paper Code : 12271403

Name of the Paper : Introductory Econometrics

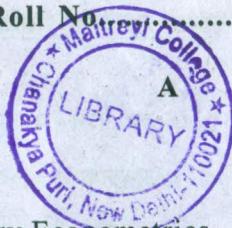

Name of the Course : CBCS Core ECO (HONS)

Semester : IV

Duration : 3 Hours Maximum Marks : 75

Instructions for Candidates

1. Write your Roll No. on the top immediately on receipt of this question paper.
2. Answer any Five questions out of Seven.
3. All questions carry equal marks.
4. Use of simple non-programmable calculator is allowed. Statistical tables are attached for your reference. Numbers may be rounded off to two decimal places for all calculations.
5. Answers may be written either in English or Hindi; but the same medium should be used throughout the paper.

छात्रों के लिए निर्देश

1. इस प्रश्न-पत्र के मिलते ही ऊपर दिए गए निर्धारित स्थान पर अपना अनुक्रमांक लिखिए।
2. सात में से किन्हीं पाँच प्रश्नों के उत्तर दीजिए।
3. सभी प्रश्नों के अंक समान हैं।
4. साधारण गैर-प्रोग्राम योग्य कैलकुलेटर के उपयोग की अनुमति है। आपके संदर्भ के लिए सार्विकीय सारणियां संलग्न हैं। सभी गणनाओं के लिए दो दशमलव स्थानों पर संख्याओं को गोल किया जा सकता है।
5. इस प्रश्न-पत्र का उत्तर अंग्रेजी या हिंदी किसी एक भाषा में दीजिए, लेकिन सभी उत्तरों का माध्यम एक ही होना चाहिए।

1. State whether the following statements are True or False. Justify your answer.
 - (i) In linear regression models, r^2 value is invariant to changes in the unit of measurement, as it is dimensionless.
 - (ii) An addition of a variable in a regression model with 30 observations and 4 variables, would always lead to a rise in the R^2 and adjusted R^2 , given that the additional variable is statistically significantly different from zero at $\alpha=20\%$.
 - (iii) In the regression involving standardized variables, the intercept term is always zero.
 - (iv) The correlation coefficient between $U = 3X+2$ and $V = -4Y+5$ is the same as between X and Y .
 - (v) In a multiple regression model $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$, testing a joint restriction $H_0: \beta_2 = \beta_3 = 0$ is same as testing for $H_0: \beta_2 = 0$ and $H_0: \beta_3 = 0$.
- (5×3=15)

1. बताएं कि निम्नलिखित कथन सही हैं या गलत। अपने जवाब का औचित्य साबित कीजिये।

- (i) रेखिक प्रतिगमन मॉडल में, R^2 मान माप इकाई में परिवर्तन के लिए अपरिवर्तनीय है, क्योंकि यह आयाम रहित है।
 - (ii) 30 अवलोकनों और 4 चरों के साथ प्रतिगमन मॉडल में एक चर के अतिरिक्त, हमेशा R^2 और समायोजित R^2 में वृद्धि की ओर ले जाएगा, यह देखते हुए कि अतिरिक्त चर $\alpha = 20\%$ पर शून्य से सांख्यिकीय रूप से महत्वपूर्ण रूप से भिन्न है।
 - (iii) मानकीकृत चर वाले प्रतिगमन मॉडल में, अवरोधन शब्द हमेशा शून्य होता है।
 - (iv) $U = 3X+2$ और $V = -4Y+5$ के बीच सहसंबंध गुणांक वही है जो X और Y के बीच है।
 - (v) एकाधिक प्रतिगमन मॉडल $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$, एक संयुक्त प्रतिबंध $H_0: \beta_2 = \beta_3 = 0$ का परीक्षण $H_0: \beta_2 = 0$ और $H_0: \beta_3 = 0$ के परीक्षण के समान है।
- (5×3=15)

2. (a) Consider the model

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$$

where,

Y_i is the long term consumption measured in Rs thousands

X_{2i} is the income measured in Rs thousands

X_{3i} is the age measured in years

- (i) How will the estimated intercept and slope coefficients change if the unit of measurement of income is changed to Rs lakhs.
- (ii) Suppose the researcher thinks that usually consumption increases with income but at a decreasing rate and consumption increases with age. How would he modify the model to see whether the data supports his hypothesis?
- (iii) Suppose the researcher wants to assess the relative importance of age and income on long term consumption, what model should he estimate? Explain.

(3+2+2)

- (b) Let X_2 be the hours spent on Mathematics coaching during a week, X_3 be the time spent on studying other subjects and Y be the scores obtained in the mathematics final exam. The following summations for 23 students were obtained as below:

$$\bar{X}_2 = 10, \bar{X}_3 = 5, \bar{Y} = 12 \quad n=23$$

$$\sum x_2^2 = 12, \sum x_2 x_3 = 8, \sum x_3^2 = 12, \sum x_2 y = 10, \sum x_3 y = 8, \sum y^2 = 10$$

x_2, x_3 and y are variables measured in deviation form.

- (i) Estimate the following regression $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$
- (ii) Estimate the standard errors of the slope coefficients.
- (iii) Obtain R^2 of the regression.
- (iv) Interpret the slope coefficients and comment on their statistical significance.

(2+3+1+2)

2. (क) मॉडल पर विचार कीजिये:

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$$

जहाँ पर,

Y_i हजारों रुपये में मापी गई लंबी अवधि की खपत है

X_{2i} हजारों रुपये में मापी गई आय है

X_{3i} वर्षों में मापी गई आय है

- (i) यदि आय की माप की इकाई को लाख रुपये में बदल दिया जाए तो अनुमानित अवरोधन और ढालन गुणांक कैसे बदलेंगे।
- (ii) मान लीजिए कि शोधकर्ता सोचता है कि आम तौर पर आय के साथ खपत बढ़ती है लेकिन घटती दर पर और खपत उम के साथ बढ़ती है। वह यह देखने के लिए मॉडल को कैसे संशोधित करेगा कि डेटा उसकी परिकल्पना का समर्थन करता है या नहीं?
- (iii) मान लीजिए कि शोधकर्ता लंबी अवधि के उपभोग पर उम और आय के सापेक्ष महत्व का आकलन करना चाहता है, तो उसे किस मॉडल का अनुमान लगाना चाहिए? व्याख्या कीजिये।

(3+2+2)

(ख) मान लीजिये X_2 एक सप्ताह के दौरान गणित की कोचिंग पर बिताए गए घंटे हैं, X_3 अन्य विषयों के अध्ययन में बिताया गया समय है और Y गणित की अंतिम

परीक्षा में प्राप्त अंक हैं। 23 छात्रों के लिए निम्नलिखित सारांश निम्नानुसार प्राप्त किए गए थे:

$$\bar{X}_2 = 10, \bar{X}_3 = 5, \bar{Y} = 12 \quad n=23$$

$$\sum x_2^2 = 12, \sum x_2 x_3 = 8, \sum x_3^2 = 12, \sum x_2 y = 10, \sum x_3 y = 8, \sum y^2 = 10$$

x_2, x_3 और y विचलन रूप में मापे गए चर हैं।

- (i) निम्नलिखित प्रतिगमन का अनुमान लगाएं $Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + u_i$
- (ii) ढालन गुणांक की मानक त्रुटियों का अनुमान लगाएं।
- (iii) प्रतिगमन के R^2 प्राप्त कीजिये।
- (iv) ढालन गुणांक की व्याख्या कीजिये और उनके सांख्यिकीय महत्व पर टिप्पणी कीजिये।

(2+3+1+2)

3. a) An individual is hired to determine the best location for the next branch of a famous family restaurant chain 'Foodies'. The individual decides to build a regression model to explain the gross sales volume at each of the restaurants in the chain as a function of various descriptors of the location of that branch. He considers the following regression (original):

$$\hat{Y}_i = 102,192 - 9075 N_i + 0.3547 P_i + 1.288 I_i$$

$$se = \quad \quad \quad (2053) \quad (0.0727) \quad (0.543)$$

$$n = 22 \quad R^2 = 0.579 \quad RSS = 384.27$$

where Y = gross sales volume, N = the number of competitive restaurants nearby, P = the population nearby, and I = the average household income nearby.

- (i) Interpret the slope coefficients of the regression and R^2 .
- (ii) Suppose we add another variable A to the regression above where A = address of the restaurant. Consider the modified regression given below:

$$\hat{Y}_i = 98,125 - 8975 N_i + 0.360 P_i + 1.301 I_i + 58.07 A_i$$

$$se = \quad \quad \quad (2082) \quad (0.074) \quad (0.550) \quad (95.21)$$

$$n = 22 \quad R^2 = 0.695$$

Do you think adding a new variable A has improved the fit of the equation? Why/Why not?

- (iii) Do you suspect a problem in part (ii) above? What is the problem and what could be the consequences of the problem? How will you correct for the problem?
- (iv) How do you conduct Ramsey RESET test to check for the likelihood of specification error in the model?

(v) Suppose the average household income (I) is not measured correctly. What are the consequences of this on the properties of the OLS estimators? (2+2+3+3+2)

b) The following regression is run on 240 observations.

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + u_i$$

The residuals obtained have respective skewness and kurtosis values - 0.097 and 2.56.

On the basis of the given information, how would you test the Normality assumption of residuals. State the Null and Alternative hypotheses. Do you think that the test is valid if the regression is run on 10 observations? (2+1)

3. क) एक प्रसिद्ध पारिवारिक रेस्तरां शृंखला 'फूडीज़' की अगली शाखा के लिए सर्वोत्तम स्थान निर्धारित करने के लिए एक व्यक्ति को काम पर रखा जाता है। व्यक्ति उस शाखा के स्थान के विभिन्न विवरणों के कार्य के रूप में शृंखला के प्रत्येक रेस्तरां में सकल बिक्री की मात्रा की व्याख्या करने के लिए एक प्रतिगमन मॉडल बनाने का निर्णय लेता है। वह निम्नलिखित प्रतिगमन (मूल) पर विचार करता है:

$$\begin{aligned} \hat{Y}_i &= 102,192 - 9075 N_i + 0.3547 P_i + 1.288 I_i \\ se &= \quad (2053) \quad (0.0727) \quad (0.543) \\ n &= 22 \quad R^2 = 0.579 \quad RSS = 384.27 \end{aligned}$$

जहाँ Y = सकल बिक्री की मात्रा, N = आस-पास के प्रतिस्पर्धी रेस्तरां की संख्या,

P = आस-पास की जनसंख्या, और I = आस-पास की औसत घरेलू आय।

- (i) प्रतिगमन और R^2 के ढान गुणांक की व्याख्या कीजिये।
- (ii) मान लीजिए कि हम ऊपर के प्रतिगमन में एक और चर A जोड़ते हैं जहाँ A = रेस्तरां का पता। नीचे दिए गए संशोधित प्रतिगमन पर विचार कीजिये:

$$\begin{aligned} \hat{Y}_i &= 98,125 - 8975 N_i + 0.360 P_i + 1.301 I_i + 58.07 A_i \\ se &= \quad (2082) \quad (0.074) \quad (0.550) \quad (95.21) \\ n &= 22 \quad R^2 = 0.695 \end{aligned}$$

क्या आपको लगता है कि एक नया चर A जोड़ने से समीकरण के फिट में सुधार हुआ है? क्यों, क्यों नहीं?

- (iii) क्या आपको उपरोक्त भाग (ii) में किसी समस्या का संदेह है? समस्या क्या है और समस्या के परिणाम क्या हो सकते हैं? आप समस्या को कैसे ठीक करेंगे?
- (iv) मॉडल में विनिर्देश त्रुटि की सम्भावना की जांच के लिए आप रैम्से रीसेट परीक्षण (Ramsey RESET Test) कैसे आयोजित करते हैं?
- (v) मान लीजिए कि औसत घरेलू आय (I) को सही ढंग से नहीं मापा जाता है। इसका OLS अनुमानों के गुणों पर क्या प्रभाव पड़ता है? (2+2+3+3+2)

छ) निम्नलिखित समाश्रयण 240 प्रेक्षणों पर चलाया जाता है।

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + u_i$$

प्राप्त अवशेषों में संबंधित तिरछापन (skewness) और कर्टोसिस (kurtosis) मान -0.097 और 2.56 हैं। दी गई जानकारी के आधार पर, आप अवशिष्टों की सामान्यता धारणा का परीक्षण कैसे करेंगे। शून्य और वैकल्पिक परिकल्पनाओं का उल्लेख कीजिए। क्या आपको लगता है कि परीक्षण मान्य है यदि प्रतिगमन 10 अवलोकनों पर चलाया जाता है? (2+1)

4. a) A regression equation includes a quantitative dependent variable (Y =wages), a quantitative independent variable (X =years of experience) and two qualitative variables; Gender and Education Level with two categories each; Male & Female; and Graduate & not a Graduate. Assume that the qualitative variables do not interact with each other.

(i) Using intercept dummy variables, write the wage regression model if the impact of years of experience, gender and education level is to be analyzed on wages (use Female Graduate as the reference category). Write the estimated equation for Male Graduate category.

(ii) How would answer in part (i) be changed if the Educational Level has three categories instead, namely; Graduate, Post-Graduate & Ph.D.

(iii) Based on part (ii), write the wage equation for the two specific categories, (a) Female with Ph.D. (b) Male Post-Graduates.

(iv) How would the model in part (ii) be modified if the objective is to examine whether the marginal effect of experience is gender-specific?

(v) How would the regression in part (i) be modified if qualitative variables interact with each other? (2+2+2+2+2)

b) A random sample of 200 vehicles traveling on rough roads with a posted speed limit of 35 mph on such roads resulted in a sample mean speed of 37.5 mph and a sample standard deviation of 8.6 mph, whereas another random sample of 200 vehicles with a posted speed limit of 55 mph resulted in a sample mean and sample standard deviation of 35.8 mph and 9.2 mph, respectively. carry out a test at 10% significance level to decide whether the two population distribution variances are identical. (5)

4. क) प्रतिगमन समीकरण में एक मात्रात्मक आक्षित चर (Y = मजदूरी), एक मात्रात्मक स्वतंत्र चर (X =वर्ष का अनुभव) और दो गुणात्मक चर लिंग और शिक्षा स्तर शामिल हैं; प्रत्येक की दो श्रेणियाँ हैं; पुरुष अथवा महिला और ग्रेजुएट अथवा ग्रेजुएट नहीं। मान लीजिए कि दोनों गुणात्मक चर एक दुसरे को प्रभावित नहीं करते।

(i) अवरोधन मूक चर (intercept dummy variables) का उपयोग करते हुए, मजदूरी का रिग्रेशन मॉडल लिखिए, यदि वेतन पर वर्ष के अनुभव, लिंग और शिक्षा स्तर के प्रभाव का

विश्लेषण किया जाना है (संदर्भ श्रेणी के रूप में महिला स्नातक का उपयोग कीजिये)। पुरुष स्नातक श्रेणी के लिए अनुमानित समीकरण लिखिए।

(ii) यदि शैक्षिक स्तर में बजाय तीन श्रेणियाँ हैं, अर्थात् ग्रेजुएट, पोस्ट ग्रेजुएट अथवा पीएचडी तब आग (i) में उत्तर कैसे बदलेगा?

(iii) आग (ii) के आधार पर, दो विशिष्ट श्रेणियों के लिए वेतन समीकरण लिखिए, (क) पीएचडी के साथ महिला (ख) पुरुष स्नातकोत्तर।

(iv) यदि उद्देश्य यह जांचना है कि क्या अनुभव का सीमांत प्रभाव लिंग-विशिष्ट है, तो आग (ii) में मॉडल को कैसे संशोधित किया जाएगा?

(v) यदि गुणात्मक घर एक दूसरे के साथ परस्पर क्रिया करते हैं, तो आग (i) में प्रतिगमन को कैसे संशोधित किया जाएगा? (2+2+2+2+2)

ख) 200 वाहनों के एक यादचिक नमूना जिसका 35 मील प्रति घंटे की गति सीमा के साथ उबड़-खाबड़ सड़कों पर यात्रा करने पर परिणामस्वरूप नमूना औसत गति 37.5 मील प्रति घंटे और नमूना मानक विचलन 8.6 मील प्रति घंटे पाया जाता है, जबकि 200 वाहनों का एक और यादचिक नमूना है जिसका 55 मील प्रति घंटे की गति सीमा के परिणामस्वरूप क्रमशः नमूना माध्य 35.8 मील प्रति घंटे और नमूना मानक विचलन 9.2 मील प्रति घंटे पाया जाता है। 10% महत्व स्तर पर एक परीक्षण कीजिये कि दो जनसंख्या वितरण बिन्नताएं समान हैं या नहीं। (5)

5. Quarterly data on country XYZ was collected for the period 2005-2019 to estimate the relation between foreign direct investment (FDI), trade openness (TO), gross domestic product (GDP) and exchange rate (E). TO is defined as ratio of export plus imports to GDP and t = trend. Following regression was estimated:

$$\overline{FDI}_t = -0.58 + 0.012 E_t - 0.025 TO_t + 0.006 GDP_t + 0.34 t$$

$$se = (0.097) \quad (0.013) \quad (0.004) \quad (0.015) \quad (0.09)$$

$$R^2 = 0.904 \quad d=1.45$$

(i) Interpret the estimated slope coefficients. Do you suspect some problem with the above regression?

(ii) What is the nature of the problem? How do you know? Explain its consequences?

$\frac{\overline{FDI}_t}{GDP_t} = \beta_0 + \beta_1 \frac{E_t}{GDP_t} + \beta_2 \frac{TO_t}{GDP_t} + \beta_3 \frac{t}{GDP_t} + u_t$. Will this transformation solve the problem mentioned in (ii) above? How? Can you compare R² of this model with the model above?

(iii) Suppose now the regression is estimated as given below:

$$\overline{FDI}_t = -0.74 - 0.042 TO_t + 0.41 t$$

$$se = (0.057) \quad (0.019) \quad (0.364)$$

$$R^2 = 0.896 \quad d=1.34$$

Test whether the regression specified above suffers from first order autocorrelation? Which test will you use and why? (Use $\alpha = 5\%$)

(iv) If the errors obtained from regression specified in (iii) above follows higher order autoregressive process then how would you test for serial correlation? Give the steps of the test in detail.

(v) With reference to the regression specified in part (iii). What will be the remedy for the problem of autocorrelation if it is detected? Explain.

(2+3+3+3+4)

5. देश XYZ पर 2005-2019 की अवधि के लिए ऐमासिक डेटा प्रत्यक्ष विदेशी निवेश (FDI), व्यापार खुलापन (TO), सकल घरेलू उत्पाद (GDP) और विनियम दर (E) के बीच संबंध का अनुमान लगाने के लिए एकत्र किया गया था। TO को नियांत और आयात के अनुपात के रूप में परिभ्राष्ट किया गया है और t = प्रवृत्ति। निम्नलिखित प्रतिगमन का अनुमान लगाया गया था:

$$\overline{FDI}_t = -0.58 + 0.012 E_t - 0.025 TO_t + 0.006 GDP_t + 0.34 t$$

$$se = (0.097) \quad (0.013) \quad (0.004) \quad (0.015) \quad (0.09)$$

$$R^2 = 0.904 \quad d=1.45$$

(i) अनुमानित ढलान गुणांक की व्याख्या कीजिये। क्या आपको उपरोक्त प्रतिगमन के साथ कुछ समस्या का संदेह है?

(ii) समस्या की प्रकृति क्या है? आपको कैसे मालूम? इसके दुष्परिणाम बताएं?

$\frac{\overline{FDI}_t}{GDP_t} = \beta_0 + \beta_1 \frac{E_t}{GDP_t} + \beta_2 \frac{TO_t}{GDP_t} + \beta_3 \frac{t}{GDP_t} + u_t$. क्या यह परिवर्तन उपरोक्त (ii) में उल्लिखित समस्या का समाधान करेगा? कैसे? क्या आप इस मॉडल के R² की तुलना उपरोक्त मॉडल से कर सकते हैं?

(iii) मान लीजिए कि अब प्रतिगमन का अनुमान नीचे दिया गया है:

$$\overline{FDI}_t = -0.74 - 0.042 TO_t + 0.41 t$$

$$se = (0.057) \quad (0.019) \quad (0.364)$$

$$R^2 = 0.896 \quad d=1.34$$

परीक्षण कीजिये कि क्या ऊपर निर्दिष्ट प्रतिगमन पहले क्रम के स्वतः सहसंबंध से ग्रस्त है? आप किस परीक्षण का उपयोग करेंगे और क्यों? ($\alpha = 5\%$ का प्रयोग कीजिये)

(iv) यदि उपरोक्त (iii) में निर्दिष्ट प्रतिगमन से प्राप्त त्रुटियां उच्च क्रम ऑटोरेग्रेसिव (AR) प्रक्रिया का पालन करती हैं तो आप सीरियल सहसंबंध के लिए कैसे परीक्षण करेंगे? परीक्षण के चरणों का विस्तार से वर्णन कीजिए।

(v) भाग (iii) में निर्दिष्ट प्रतिगमन के संदर्भ में, स्वसहसंबंध की समस्या का पता चलने पर उसका क्या उपाय होगा? समझाइये। (2+3+3+4)

6. a) The Home Ministry of a country wants to test if petty crimes (minor thefts) are higher in states where poverty rates are high. They obtain data on several variables and ran the following cross section regression for 35 states in the country.

$$C_t = 6.275 + 0.1147 PR_t - 0.0712 LR_t + 0.0862 SDP_t$$

$$Se = (3.125) \quad (0.02713) \quad (0.0361) \quad (0.03834)$$

$$n = 35 \quad R = 0.6876$$

where C = Crimes per lakh of population

PR = poverty rates

LR = Literacy rate

SDP = State Domestic Product

- (i) A priori what signs are expected for the explanatory variables? Explain your answers.
- (ii) Test for overall goodness of fit of the regression (Use $\alpha = 5\%$)
- (iii) Another model was also used and following results were obtained:

$$\ln C_t = 2.142 + 0.01186 \ln PR_t - 0.0548 \ln LR_t + 0.0921 \ln SDP_t$$

$$Se = (1.102) \quad (0.0673) \quad (0.0259) \quad (0.03647)$$

$$n = 35 \quad R^2 = 0.7923$$

Interpret the coefficient of $\ln SDP$.

(iv) How will you conduct MacKinnon-White-Davidson (MWD) test to select which model is better? Write all steps clearly. (2+2+2+3)

b) The regression equation given in part (a) is modified as follows:

$$\hat{C}_t = 23.83 - 0.0089 LR_t$$

This equation was estimated using 50 cross-sectional observations on states, by ordinary least squares (OLS). To check for heteroscedasticity related to LR , separate regressions were run for the 17 states with the lowest LR and the 17 states with the highest LR . The sum of

squared residuals for the low LR states was 270. The sum of squared residuals for the high- LR states was 90.

- (i) Compute unbiased estimates of the variance of the error term in the two subsamples.
- (ii) Conduct the Goldfeld-Quandt test at 5% level of significance.
- (iii) Regardless of your conclusion for part (ii), suppose you believe that heteroscedasticity is indeed present and that the variance of the error term is inversely proportional to state LR : $Var(\varepsilon_t) = \gamma / LR_t$, where γ = an unknown constant. Explain how you would transform the data to satisfy the classical assumptions. (2*3=6)

6. क) किसी देश का गृह मंत्रालय यह जांचना चाहता है कि क्या छोटे अपराध (मामूली चोरी) उन राज्यों में अधिक हैं जहां गरीबी दर अधिक है। वे कई चरों पर डेटा प्राप्त करते हैं और देश के 35 राज्यों के लिए निम्नलिखित क्रॉस सेक्शन प्रतिगमन का अनुमान लगते हैं:

$$C_t = 6.275 + 0.1147 PR_t - 0.0712 LR_t + 0.0862 SDP_t$$

$$Se = (3.125) \quad (0.02713) \quad (0.0361) \quad (0.03834)$$

$$n = 35 \quad R = 0.6876$$

जहाँ C = प्रति लाख जनसंख्या पर अपराध

PR = गरीबी दर

LR = साक्षरता दर

SDP = राज्य घरेलू उत्पाद

(i) एक प्राथमिकता व्याख्यात्मक चर के लिए क्या संकेत अपेक्षित हैं? अपने उत्तरों की व्याख्या कीजिये।

(ii) प्रतिगमन के फिट की समग्र अच्छाई के लिए परीक्षण कीजिये। ($\alpha = 5\%$ का प्रयोग कीजिये)

(iii) एक अन्य मॉडल का भी उपयोग किया गया और निम्नलिखित परिणाम प्राप्त हुए:

$$\ln C_t = 2.142 + 0.01186 \ln PR_t - 0.0548 \ln LR_t + 0.0921 \ln SDP_t$$

$$Se = (1.102) \quad (0.0673) \quad (0.0259) \quad (0.03647)$$

$n = 35 \quad R^2 = 0.7923$

In एसडीपी के गुणांक की व्याख्या कीजिये।

- (iv) कौन सा मॉडल बेहतर है यह चुनने के लिए आप मैकिनॉन-व्हाइट-डेविडसन (MWD) परीक्षण कैसे करेंगे? सभी चरणों को स्पष्ट रूप से लिखिए। (2+2+2+3)

- ख) भाग (क) में दिए गए प्रतिगमन समीकरण को निम्नानुसार संशोधित किया गया है:

$$\hat{C}_i = 23.83 - 0.0089 LR_i$$

सामान्य न्यूनतम वर्गी (OLS) द्वारा राज्यों पर 50 क्रॉस-सेक्शनल अवलोकनों का उपयोग करके इस समीकरण का अनुमान लगाया गया था। LR से संबंधित विषमताँगता (heteroscedasticity) की जाँच करने के लिए, सबसे कम LR वाले 17 राज्यों और उच्चतम LR वाले 17 राज्यों के लिए अलग-अलग प्रतिगमन अनुमान लगाए गए थे। निम्न LR राज्यों के लिए वर्ग अवशिष्टों का योग 270 था। उच्च-LR राज्यों के लिए वर्ग अवशिष्टों का योग 90 था।

- (i) दो उप-नमूनों में त्रुटि पद के विचरण के निष्पक्ष अनुमानों की गणना कीजिये।
- (ii) गोल्डफेल्ड-क्वांट वर्गी को 5% महत्व के स्तर पर आयोजित कीजिये।
- (iii) भाग (ii) के लिए आपके निष्कर्ष के बावजूद, मान लीजिए कि विषमताँगता वास्तव में मौजूद है और त्रुटि का विचरण राज्य LR के व्युत्क्रमानुपाती है: $Var(\varepsilon_i) = \gamma / LR_i$, जहां γ = एक अज्ञात लगातार। स्पष्ट कीजिये कि आप शास्त्रीय मान्यताओं को संतुष्ट करने के लिए डेटा को कैसे रूपांतरित करेंगे। (2*3=6)

7. a) The estimated equation for sales of TV is as given below:

$$\text{Sales} = 118.91 - 7.908 \text{ Price} + 1.863 \text{ Advert}$$

$$(se) = (6.35) \quad (1.096) \quad (0.683) \quad R^2 = 0.448, n=30$$

where Price is price of TV measured in Rs.

Sales is sale revenue and Advert is advertising expenditure. Both Sales and Advert are measured in terms of thousands of rupees.

- (i) Is the slope coefficient of price statistically different from 1? Test at $\alpha=2\%$.
- (ii) Calculate the elasticity of sales revenue with respect to price if average sales revenue is 300 and average price is 100?

(iii) How would you test that an increase in advertising expenditure will bring an increase in sales revenue that is sufficient to cover the increased advertising expenditure? Clearly state the null and alternative hypotheses. Test at $\alpha=5\%$.

(iv) Estimate the sales revenue for a price of Rs 6 and an advertising expenditure of Rs 1,200. (3+2+3+2)

- b) Consider the following regression $Y_i = \beta_1 X_i + \mu_i$ where $\tilde{\beta}_1$ is the OLS estimator of β_1 .

- (i) Find the value of $\tilde{\beta}_1$.
(ii) Find $V(\tilde{\beta}_1)$.
(iii) Verify that $\tilde{\beta}_1$ is unbiased. (5)

7. क) टीवी की बिक्री के लिए अनुमानित समीकरण नीचे दिया गया है:

$$\text{Sales} = 118.91 - 7.908 \text{ Price} + 1.863 \text{ Advert}$$

$$(se) = (6.35) \quad (1.096) \quad (0.683) \quad R^2 = 0.448, n=30$$

जहां price टीवी की कीमत रुपये में मापा जाता है।

Sales बिक्री राजस्व है और Advert विज्ञापन व्यय है। बिक्री और विज्ञापन दोनों को हजारों रुपये में मापा जाता है।

- (i) क्या मूल्य का ढलान गुणांक सांख्यिकीय रूप से 1 से भिन्न है? $\alpha=2\%$ पर टेस्ट कीजिये।

- (ii) कीमत के संबंध में बिक्री राजस्व की लोच की गणना कीजिये यदि औसत बिक्री राजस्व 300 है और औसत मूल्य 100 है?

- (iii) आप कैसे परीक्षण करेंगे कि विज्ञापन व्यय में वृद्धि से बिक्री राजस्व में वृद्धि होगी जो बढ़े हुए विज्ञापन व्यय को कवर करने के लिए पर्याप्त है? रिक्त और वैकल्पिक परिकल्पनाओं को स्पष्ट रूप से बताएं। $\alpha=5\%$ पर टेस्ट कीजिये।

- (iv) 6 रुपये की कीमत और 1,200 रुपये के विज्ञापन व्यय के लिए बिक्री राजस्व का अनुमान लगाएं। (3+2+3+2)

- ख) निम्नलिखित प्रतिगमन पर विचार कीजिये $Y_i = \beta_1 X_i + \mu_i$ जहां $\tilde{\beta}_1$ β_1 का OLS अनुमान है।

- (i) $\tilde{\beta}_1$ का मान जात कीजिये।

- (ii) $V(\tilde{\beta}_1)$ खोजिये।

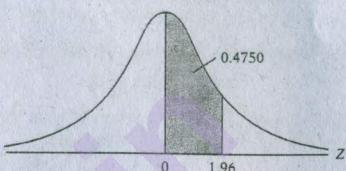

- (iii) सत्यापित कीजिये कि $\tilde{\beta}_1$ निष्पक्ष है। (5)

TABLE D.1
Areas Under the
Standardized Normal
Distribution

Example

$$\Pr(0 \leq Z \leq 1.96) = 0.4750$$

$$\Pr(Z \geq 1.96) = 0.5 - 0.4750 = 0.025$$

Note: This table gives the area in the right-hand tail of the distribution (i.e., $Z \geq 0$). But since the normal distribution is symmetrical about $Z = 0$, the area in the left-hand tail is the same as the area in the corresponding right-hand tail. For example, $\Pr(-1.96 \leq Z \leq 0) = 0.4750$. Therefore, $\Pr(-1.96 \leq Z \leq 1.96) = 2(0.4750) = 0.95$.

TABLE D.2
Percentage Points of
the t Distribution

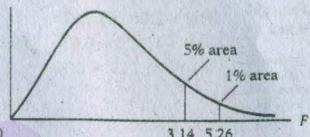

Source: From E. S. Pearson and H. O. Hartley, eds., *Biometrika Tables for Statisticians*, vol. I, 3d ed., table 12, Cambridge University Press, New York, 1966. Reproduced by permission of the editors and trustees of *Biometrika*.

Example
 $\Pr(t > 2.086) = 0.025$
 $\Pr(t > 1.725) = 0.05$ for $df = 20$
 $\Pr(|t| > 1.725) = 0.10$

Pr df	0.25 0.50	0.10 0.20	0.05 0.10	0.025 0.05	0.01 0.02	0.005 0.010	0.001 0.002

TABLE D.4
Upper Percentage
Points of the χ^2
Distribution

Example
 $\Pr(\chi^2 > 10.85) = 0.95$
 $\Pr(\chi^2 > 23.83) = 0.25$ for df = 20
 $\Pr(\chi^2 > 31.41) = 0.05$
